User & Operations Manual

A practical reference guide for managing daily water deliveries, store records, and driver workflows.

Client	Veekay Aquatech
Prepared By	Shagun Bhatia
Role	Software Developer
System Status	Live Production
Handover Date	June 9, 2026
Document Version	1.4.0-Refined

Handover manual built for Veekay Aquatech. This is a practical user guide for the office staff, store partners, and delivery drivers using AquaTrack daily.

    5.3 Store Manager Modules 9

    5.4 Delivery Manager Mobile App 10

6. Compliance Records 11

7. Complaint Management 11

8. QR Module Status 12

9. Summary & Closing Notes 12

1. Project Overview

AquaTrack is currently being used by Veekay Aquatech to manage daily water delivery operations, store management, delivery assignments, compliance records, and complaint tracking across multiple locations. This manual serves as a clean and straightforward reference guide for operations managers, office staff, and on-ground partners to understand and navigate daily software features.

This document has been prepared to help Veekay Aquatech understand the current AquaTrack workflow, user roles, and day-to-day operational process. The focus is on practical system usage rather than technical implementation details.

2. Business Purpose of AquaTrack

Veekay Aquatech supplies 20-litre drinking water jars to partner store networks across India, including Blinkit, Zepto, BKC and other business customers. Different local vendors and delivery partners supply water to these stores based on their assigned regions. AquaTrack was developed to manage store operations, order tracking, delivery partner assignments, vendor coordination, compliance records, and day-to-day operational activities through a single platform.

The system handles the following core operational areas:

- Delivery Tracking: Keeps a live record of water orders moving from store warehouses to final customer locations.
- Store Coordination: Manages localized warehouse listings, account access permissions, and monthly delivery caps.
- Driver Mobile Application: Provides field delivery drivers with a direct smartphone checklist to manage drop-offs on their routes.
- Compliance Records: Archives necessary documentation, such as weekly driver log sheets and monthly partner invoices, cleanly in one central view.
- Complaint Management: Gathers support tickets from stores and drivers into a central list for quick office reviews and check-offs.

Practical Value: This application unifies your daily logs, completely replacing messy physical logbooks, manual text-messaging adjustments, and double-entry spreadsheets with a single live tool.

3. User Roles & Access Overview

The application checks an account's user type at login to present the correct dashboard panel and limit data access. This keeps team operations organized and secure.

USER ROLE	DASHBOARD VIEW ACCESS	DAILY OPERATIONAL FOCUS
Super Admin	All Web Office Management Screens	Manages system parameters, assigns unallocated orders, provisions login credentials, adjusts store limits, and verifies archives.
Channel Admin	Assigned Channel Views Only	Tracks order counts, keeps point-of-contact lists updated, and reviews issues for a single app network (like Blinkit or Zepto).
Store Manager	Assigned Store Hub Panel Only	Prepares daily order queues, logs returned empty water jars, and uploads local safety lab results.
Delivery Manager	Driver Mobile Phone Application Only	Looks up assigned routes, moves delivery task statuses, and photographs paper logs in the field.

4. Core Business Workflow

The system runs an automatic feature that processes and routes daily delivery allocations using a series of sequential rules:

Step 1: Daily Order Sync
Every day at exactly 10:00 AM, the system runs automatically, pulling new delivery requests from your connected partner app channels.

Step 2: Store Assignment
The software matches incoming orders with the appropriate store based on configured store mapping and delivery areas.

Step 3: Delivery Partner Assignment
The system verifies if an active, authorized delivery driver profile is assigned to that specific store's regional logistics area.

Step 4: Order Routing

- Path A (Driver Linked): If a delivery driver is assigned to the zone, the order status switches to Pending and appears immediately in that driver's mobile app task list.
- Path B (No Driver Linked): If no driver profile is active for the route, the system blocks automatic routing. The order moves to an unassigned status and drops into the *Unassigned Orders* view for manual driver selection.

Step 5: Delivery Processing
When the field driver handles the order, they update its progress on their phone screen through three straightforward states: Pending, In Transit, Delivered.

Step 6: Reports & Status Updates
The moment the driver clicks "Mark Delivered", the order log updates across the system, immediately refreshing store volumes, app channel totals, and main admin reports.

5. Module Documentation

This section outlines the specific screens, user menus, and data panels built into the AquaTrack setup, detailing how your team uses each layout screen daily.

5.1 Super Admin Modules

Dashboard Screen
Helps the team track daily operations by combining active logs into a single view. It displays live counter cards for ongoing deliveries, unassigned order blocks, unresolved complaints, and missing store compliance files, along with an operational bar chart comparing Blinkit and Zepto dispatch volumes.

Unassigned Orders Screen
Shows orders that could not be assigned automatically and allows manual assignment. The application holds these items here, blocking them from store lists until a dispatcher opens the row and selects an available regional driver from the dropdown menu.

Order Management Screen
A master lookup table used to find and track any order entry saved in the system. Your office team can search the historical log using custom calendar dates, specific store hubs, partner apps, or active delivery states. It also includes utility buttons to cancel or re-route runs during logistical delays.

Create Store Manager Screen
Registers system login credentials and profile details for new warehouse partners. The form validates that the input business email is unique, creates login access and links the user to the assigned store to prevent role overlap.

Store Managers Screen
A central dashboard directory used to monitor operator accounts, check login timestamps, and manage active permissions. Toggling a partner's profile switch to inactive immediately ends their web session and blocks access to backend data paths.

Delivery Partners Screen
Registers your delivery drivers, tracks their mobile phone lines, and manages their assigned service routes. It maps field personnel directly to their designated delivery territories so the daily 10:00 AM system task can match them to corresponding store order queues.

Complaints Screen
A single help desk panel used to review, document, and close operational issues raised by platform users. It organizes incoming tickets into a prioritized checklist, allows administrators to review, manage, and close complaints submitted by users, and requires an explanation note before a ticket can be closed.

Reports Screen
Compiles historical operational metrics into downloadable data spreadsheets for bookkeeping and offline review. Office staff can filter metrics dynamically by calendar dates, partner applications, or individual warehouses, downloading clean Excel sheets optimized to prevent system slowdowns.

Active Stores Module
It acts as the central control profile for each warehouse store. Admins use this layout to toggle the daily 10:00 AM automated sync on or off, define delivery frequencies (like daily runs or alternating days), map third-party store identifier codes, and enforce maximum monthly container counts to protect stores from order over-allocation.

QR Module
QR-based bottle tracking is planned for a future phase and is currently not active in the live system.

Delivery Area Screen
Outlines regional delivery boundaries and manages driver mappings across your storefront networks. It links store profiles and retail neighborhoods into distinct geographic zones, while highlighting empty routes to prevent delivery gaps.

Channel Admin Module
Provisions dedicated administrative profiles and dashboard preferences for external marketplace supervisors, configuring automated data settings while keeping different channel logs safely separated.

Store Compliance Repository
A central verification workspace used to review, verify, and track mandatory files and operations records across all sites. It organizes uploaded files by document types (weekly logs, monthly invoices, lab charts) and allows monitors to view, organize, and manage uploaded compliance documents with text notes.

5.2 Channel Admin Modules

The Channel Admin panel provides an isolated dashboard layout, restricting external app managers (like Blinkit or Zepto team leads) to track order data, store networks, and metrics purely related to their own company footprint.

Dashboard Screen
Displays real-time performance tallies focused on the active app network, tracking total delivery volumes, completed runs, ongoing delivery timelines, and open ticket flags within the channel's footprint.

Orders Screen
A read-only lookup table displaying historical and current order logs that originated from the partner app's system, allowing status updates to be monitored while blocking access to central office administrative controls like order cancellation or route adjustments.

Stores Screen
An informational index view listing all active storefront locations and warehouse hubs currently configured to receive and fulfill orders for the channel administrator's app network.

My POC Module
A simple team contact directory used by channel managers to organize profile details, phone numbers, and communication notes for the field staff overseeing connected routes.

Complaints Module
An issue management board where channel admins track support logs filed within their network footprint, check progress notes, and share status details with the main office team.

Reports Screen
A basic self-service data panel that extracts completed run tallies, total shipment volumes, and transit durations into clean spreadsheet downloads, saving channel managers time during weekly reconciliations.

5.3 Store Manager Modules

The Store Manager layout provides physical warehouse operators with clear digital lists to prepare daily order runs, coordinate equipment records, and maintain up-to-date health and safety certifications.

Dashboard Screen
The core local control screen, giving store operators quick summaries tracking incoming orders, active route drivers, missing document items, and empty container balances.

My Orders Screen
The primary task checklist for warehouse personnel, showing order batches routed to the location by the daily sync and tracking items through preparation, driver pickup, and final delivery confirmation.

Place Order Module
A manual order input page that allows store operators to request additional inventory units or arrange stock adjustments directly with production sites to handle unexpected local demand.

Complaints Module
Allows store managers to quickly log operational challenges, inventory balance errors, or delivery vehicle delays directly to the central admin queue for review.

Empty Bottles Module
A digital ledger sheet used to track returned container assets, allowing store teams to log incoming item counts from drivers to keep inventory records accurate.

Test Reports Module
A file upload portal where store operators submit chemical water analysis charts and regular lab results to verify local product safety compliance.

Analytics Module
Provides simple local charts tracking monthly order volumes, staging times, and asset return numbers to help optimize warehouse operations.

5.4 Delivery Manager Mobile App

The mobile application provides on-ground drivers with a fast, reliable interface built to handle poor connection zones and speed up routine delivery updates on the road.

Pending Orders Module
The primary mobile screen, organizing all routed delivery runs currently assigned to the driver into a clean task list showing store pickup points, delivery destination addresses, container counts, and step-by-step status controls.

Delivered Orders Module
A clear historical reference list displaying all deliveries completed by the driver during their active shift window, helping them easily track daily completed task counts.

My Stores Module
An informational index tab providing quick access to assigned warehouse details, including physical location directions, open hours, and store manager phone hotlinks.

Weekly Compliance Upload Module
An on-ground document capture interface for drivers to submit weekly logs and signed customer cards. It uses mobile camera features to capture clear photos and saves them into clean file formats (PDF, JPG, PNG).

Monthly Invoice Upload Module
A basic mobile accounting upload layout where delivery drivers submit photos or digital copies of monthly billing invoices directly to the administrative archive queue to speed up payment clearances.

6. Compliance Records

Maintaining organized paperwork for safety verifications and billing records is a major part of Veekay Aquatech's delivery network. The platform tracks and archives necessary documents across two main areas:

- Weekly Card Uploads: Drivers use the mobile application to upload photos of on-ground logs and signed physical signature sheets directly from the field.
- Monthly Invoice Submissions: Drivers use the mobile attachment tool to submit billing data, vendor expense tracking items, and delivery statements at regular periods.

The software fully supports standard digital formats, including PDF documents, JPG images, and PNG graphic files, allowing drivers to submit files easily using standard smartphone cameras.

6.1 Offline File Ingestion Workflow

Compliance files frequently arrive through alternative offline communication setups, such as WhatsApp chats, email threads, or physical paper handouts. To prevent missing records, administrators can manually save documents through the following steps:

1. Manual Document Review: Office staff check the incoming offline file to confirm it is readable and check the dates and store details.
2. Repository Archive Entry: The admin opens the *Store Compliance Repository* screen and uses the file upload window to save the document.
3. Property Selection: The system prompts the admin to select the matching store location profile, delivery driver name, and operational logging dates.
4. Ledger Index Update: The platform writes the manual file entry into the main tracking tables, archiving the record cleanly alongside mobile-uploaded items.

7. Complaint Management

The application includes an integrated issue ticket tracker that connects system users with administrators to ensure route errors or warehouse updates are addressed and resolved efficiently.

7.1 Submission Process

Any logged-in user—including external channel admins, warehouse managers, or mobile field drivers—can instantly open a support ticket line item from their dashboard layout, noting specific order details and descriptions.

7.2 Administrative Review & Closure

Once submitted, tickets move through a clear review process overseen by your office team:

1. Dashboard Visibility: The ticket triggers an active line item inside the Super Admin *Complaints Module* queue, marking the issue with a priority status flag.
2. Operational Evaluation: The admin checks the ticket notes, logs, and connected order history details.
3. Resolution Entry: After coordinating corrective steps with the field team or warehouse hub, the admin logs an explanation note into the mandatory description field.

1. Ticket Status Closure: The software saves the resolution notes, moves the ticket status to Closed, and notifies the originating user profile dashboard.

8. QR Module Status

QR-based bottle tracking is planned for a future phase and is currently not active in the live system.

9. Summary & Closing Notes

The AquaTrack platform is currently being used to manage daily water delivery operations, order tracking, store management, delivery partner assignments, compliance records, and complaint management for Veekay Aquatech.

This document serves as a reference guide for the current AquaTrack production system and may be updated as new features are introduced in future releases.
